We have arranged for tulip bulbs grown in England by Hollanders this year, which should be on hand the last of September. These bulbs are grown in the Lincolnshire District, which soil and climatic conditions are very similar to those in Holland. After all, these Hollanders KNOW HOW to grow bulbs, and it is our opinion that we will have the best quality bulbs this year since the war started. Of course there is danger in shipments not arriving and we cannot guarantee delivery, but we understand other merchandise is coming over.

PLANT STIMULANTS

HORMODIN POWDER

In Three Strengths
Simplifies the Rooting of Cuttings

Hormodin Powder makes it possible to propagate practically all varieties of plants from cuttings.

The Hormodin treatment enables growers to transplant from the propagating bench to the field much earlier than with the usual practice. Treated cuttings establish themselves readily when transplanted. Many species, heretofore considered impossible to propagate from cuttings, may now be grown successfully from cuttings treated with Hormodin Powder.

1 oz. powder will treat about 2,500 cuttings of average size.

ROOTONE

Improves Rooting of Cuttings, Seeds and Bulbs

Makes Heavier Grass Turf

Causes Faster Germination of Seeds

Increases Plant Growth—Reduces Wilt

When seeds and bulbs are dusted with ROOTONE and planted, germination is quicker (most noticeable in sluggish seeds like those of perennials), and root growth is faster and heavier. This means stronger, healthier plants, and frequently results in faster growth and earlier flowering.

ROOTONE keeps for years in the dry state, and becomes effective only in the presence of sufficient moisture to dissolve out the hormone, as in the seed flat or cutting bed. 1/4 oz., Pkt. 25c; 2 oz. Jar, \$1.00; 1 lb. Can, \$5.00.

TRANSPLANTONE

REDUCES LOSS IN TRANSPLANTING

Many ornamental evergreens do not respond well to chemical fertilizer, and TRANSPLANTONE is especially suited to them because it increases root systems. All the shrubs and trees that require humus around their roots, like TRANSPLANTONE. Outstanding among them are azalea, pyracantha, juniper, pine, hemlock, rhododendron, holly, and arbor vitae.

The amount of stock or transplant solution required will vary with the size of the ball of earth around the roots. A 12- to 15-inch ball takes two gallons of stock solution; a 2-foot ball, 4 gallons; a 5-foot ball, 20 gallons; and a 10-foot ball, 50 gallons. On the larger trees a layer of peat moss around the cavity will prevent it from draining off too fast.

One oz. makes 10 gallons transplant solution or 100 to 1000 gallons of weekly watering solution. Oz. can, 50c; 3 oz. can, \$1.00; 1 lb. can, \$4.00.

HARNDEN'S LAWN GRASS SEEDS AND SUPPLIES

All Prices Are Subject to Market Changes

KENTUCKY BLUE GRASS

The ideal months of the year for sowing Kentucky Blue Grass are September, October, February and March. A good crop of fine seed has been harvested this year and prices are very reasonable.

New Crop Seed Now Ready

Blue grass lawns are a man-made product and must be sowed at least once and preferably twice a year to keep in good condition. We supply to our customers only the heaviest seed of Kentucky Blue Grass in extra fine quality and of the highest germination.

HARNDEN'S EVERGREEN LAWN SEED

The Standard Lawn Mixture

A special blend of fine leafed grasses prepared especially for sowing on bare ground or for filling in bare spots on an old lawn. The body of this mixture is composed of K. C. Brand Kentucky Blue Grass blended with Red-Top and with a number of quicker growing grasses which will act as a nurse crop for the blue grass. These quicker grasses are those that will be crowded out by the blue grass or will die out the second year after the sod is well established. This is the finest combination that can be obtained for a permanent lawn.

SHADY LAWN GRASS

Our combination of fine low-growing evergreen grasses which grow in their wild native state in heavily wooded locations or other shaded or sheltered locations. This mixture will give splendid satisfaction on nearly any lawn that has bald spots under trees which ordinarily give the greatest amount of trouble to get permanently into grass. (For the further information of our customers, we advise them that the soil under trees long standing is apt to be acid or sour. This can be easily corrected by making an application of lime at the rate of 50 lbs. to 1,000 square feet.)

HARNDEN'S "TERRACE SOD" LAWN GRASS

One great difficulty in getting a terrace seeded is the fact that ordinary shallow rooted grasses are used. These are quickly killed on account of the added exposure and lack of moisture. "Terrace Sod" mixture is composed of those grasses which are deep rooted and which will stand the greatest amount of drouth and exposure. These grasses by their long-rooted characteristics aid in binding the soil together and prevent washing.

EROSIONET FOR STUBBORN TERRACES

Erosionet is a strong, economical, open-mesh fabric made of tightly twisted paper twine. When placed over any seeded surface, its ¼-inch square mesh forms millions of tiny dams which catch and hold your seed and sod firmly in place. Thus, damaging "wash-outs" from heavy rains are effectively checked without cutting off the sunlight.

Erosionet also catches and holds moisture. It helps overcome seed losses and lawn disappointments from poor germination. Erosionet never presents an unsightly appearance, clover and grasses soon rendering it almost invisible. Erosionet is rot-resisting and can easily be removed when grass becomes 2½ in. high. Comes in rolls 45 in. wide and can be purchased in any lengths. Yard, 12c.
